Additional Features

Counter

Extra contact to fire auxiliary
pumping system in the future

Burner elevation to ensure a
durable domed seal

Dusa, formerly Lumentics Inc, packages a treatment for actinic keratoses which, if untreated, may lead to squamous cell carcinoma, the second leading cause of skin cancer death in the USA. The treatment is a photodynamic therapy combining visible blue light with a topical solution. The solution is packaged in onion skin tubes and applied to the affected area via special applicator. Approximately 14 – 18 hours after application the patient returns to the doctor and, wearing protective goggles, is treated by a non-laser light source.

This product has recently received FDA approval for skin cancer and other applications for this therapy are currently under study.
