

Sustainability Program

Philosophy

As global production and population grow while the earth's natural resources shrink, being environmentally responsible is, now more than ever, just as important as providing efficient, reliable, technologically advanced products and machinery. Cozzoli Machine Company is fully committed to meeting today's challenges in protecting our environment, reducing waste, and improving our energy systems while responding to increasing demands for faster, better machines and the products these machines help disseminate globally. To this end, our sustainability program minimizes costs, materials, time and energy expended while enabling us to maintain the highest quality standards in our manufacturing of precision built filling and packaging machinery for the pharmaceutical, chemical, cosmetic, food and beverage industries.

Operations

--**Lighting.** Upon installing energy efficient shop lighting, our electrical consumption dropped by 6%.

Benefits include:

1. Providing more effective illumination.
2. Reducing electrical consumption by 62,400 kwh.
3. Preventing over 95,000 lbs. of carbon dioxide from being generated. This is equivalent to removing approximately 8 cars from the road or planting over 1110 trees.

--**Water.** We refrain from using water as part of our manufacturing operation.

Recycling

We recycle cardboard, metal cuttings and turnings, glass, plastic and metal/aluminum cans.

Refurbishing

Our new refurbishment program, which allows us to take in and repair/revamp old machines, further assists us in our efforts to preserve the environment while cutting down on costs to customers.

Solar Energy

We are in the process of installing a solar power system on our roof that will diminish greenhouse gas emissions significantly.

Products

Among the various energy and water efficient machines we manufacture, our AW (washer) Series stands out as a prime example of Cozzoli's efforts to conserve. The uniform washing permitted by upright positioning reduces the amount of cleaning media required, and an optional sanitary reclaim/recirculating system decreases water consumption by up to 80%. Additionally, segregated wash stations are designed to prevent cross contamination and resulting waste. Like all Cozzoli machines, the AW Series provides years of reliable, precise, efficient running.

At Cozzoli, we also offer a variety of environmentally responsible alternatives for our machines, such as the flush in place option available on the RPF and RFL MRM series machines.
